ClickUp

ClickUp is a project management and task tracking service. It organises work into workspaces (teams), spaces, folders and lists, and supports custom fields, checklists, comments and attachments. LadyBug Tracker reports bugs into a single ClickUp list.

This integration is currently in the **beta** stage.

Authentication

ClickUp uses personal API tokens. In the login window enter:

- **Username or Email** — your ClickUp account.
- **API Token** — a personal API token.

To generate the token, open **Settings > Apps > API Token** in ClickUp (<https://app.clickup.com/settings/apps>), click to generate it, and copy it into the API Token field. The **Generate API Token** button in the login window opens that page for you.

The host address is fixed to <https://app.clickup.com> and does not normally need changing.

Project setup (ClickUp service)

The plugin works against one ClickUp **list**. In the project settings:

- **Workspace** selects the ClickUp team.
- **Project** selects the list. Both folderless lists and lists inside a folder are found.

LadyBug Tracker stores the position a bug was reported from in two custom fields, which have to exist on the list:

1. Open the list, then **Custom Fields**.
2. Create a field named **Level** of type **Text**.
3. Create a field named **Camera** of type **Text**.

The names must match exactly. If a field is missing, the plugin reports it when the project is verified, rather than failing silently.

Free plan behaviour

A free ClickUp workspace runs out of custom field usages. When the plugin detects a free plan — or when ClickUp refuses a custom field write — it writes the Level and Camera values into the **task description** instead, so reporting keeps working without a paid plan. Custom fields are still read, so tasks created earlier under a paid plan stay complete.

Because the values then live in the description, a task written that way can no longer have those values updated separately — they travel with the description.

Task status

The completed state of a task is derived from the ClickUp status *type*: a task counts as completed when its status type is **done** or **closed**. The list therefore needs at least one open status and at least one done or closed status.

Known limitations

- The ClickUp API (v2) cannot delete attachments, so attachments can be added and viewed but not removed.
- Issue history is not available.
- Custom field usage on the free plan is limited — see Free plan behaviour above.

Project setup (Unreal Engine)

Open **Project Settings** > **Plugins** > **LadyBug Tracker** and set:

1. **Provider** — ClickUp.
2. **Host** — leave at <https://app.clickup.com>.
3. **Change Login Settings** — enter your account and API token.
4. **Workspace** — pick your ClickUp team.
5. **Project** — pick the list bugs should be reported to.

These settings are stored in Config/DefaultBugTracker.ini and can be shared with the team. Your login and token are stored separately, per user, and only when **Remember Me** is enabled.
