Redmine

Redmine is an open-source project management and issue tracking software. It provides support for multiple projects, tasks, time tracking, and version control systems. It also allows for the creation of custom reports and integration with numerous other tools.

Supported Versions

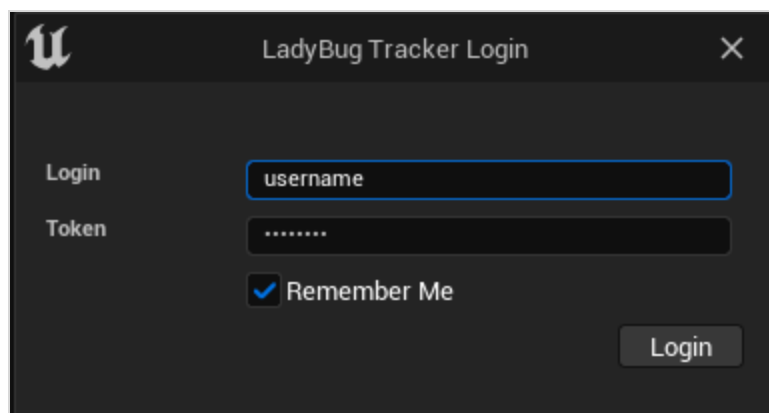

The Redmine API evolves from version to version, therefore there is no guarantee that a plugin which worked on an older version will function correctly on a later one.

Currently, the supported and only tested version is 4.x.

Version 5.x should theoretically also work, however, this has not been tested.

Authentication

Redmine integration uses simple login password authentication

The screenshot shows a dark-themed login window titled "LadyBug Tracker Login" with a close button (X) in the top right corner. On the left side, there are labels "Login" and "Token". The "Login" label is next to a text input field containing the word "username". The "Token" label is next to a password input field filled with seven asterisks. Below the password field is a checkbox that is checked, followed by the text "Remember Me". In the bottom right corner, there is a "Login" button.

Project setup (Redmine service)

LadyBug Tracker requires adding two custom fields to the project: "Level" and "Camera". Both fields must be of type "Text".

To add these fields:

1. Go to the Administration panel, then Custom Fields.
2. Click on "New Custom Field" and select "Issue", then click "Next".
3. Set the format to "Text" and the name to "Level".
4. Select the project to which this field should be added.
5. Choose the appropriate Trackers. Most likely, you would want to use "Bug".
6. Click "Create".

Then, repeat these steps for the "Camera" field.

The screenshot shows the Redmine web interface for configuring a custom field. The page title is "Custom fields >> Issues >> Level". The main form is divided into two columns. The left column contains fields for "Format" (set to "Text"), "Name *" (set to "Level"), "Description", "Min - Max length", "Regular expression" (with a hint "eg. ^[A-Z0-9]+\$"), "Text formatting" (unchecked), "Default value", and "Link values to URL". The right column contains checkboxes for "Required", "Used as a filter", and "Searchable", all of which are unchecked. Below these are sections for "Visible" (radio buttons for "to any users" and "to these roles only", with "to any users" selected), "Trackers" (checkboxes for "Bug", "Feature", and "Support", with "Bug" selected), and "Projects" (checkboxes for "Custom field test", "project to delate", "RestrictedPermissins", "Test Proejct 2", "Test1", "subproject level 111", "Subproject level1", and "Subproject level 2", with "Test1" selected). A "Save" button is located at the bottom left of the form.

Redmine

Search:

Custom fields >> Issues >> Level

Format: Text

Name *: Level

Description

Min - Max length: -

Regular expression: eg. ^[A-Z0-9]+\$

Text formatting: ☐

☒ Bug ☐ Feature ☐ Support

Projects

For all projects: ☒

☐ Custom field test

☐ project to delate

☐ RestrictedPermissins

☐ Test Proejct 2

☒ Test1

☐ subproject level 111

☐ Subproject level1

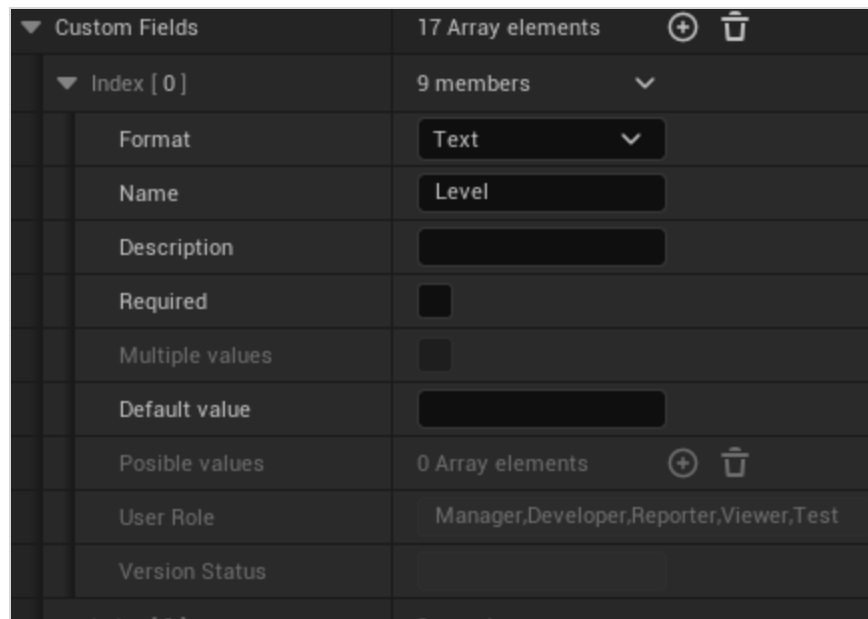

☐ Subproject level 2

Save

Project setup (Unreal Engine)

Due to limitations regarding the ability to fetch Custom Fields definitions from the server, only users with admin accounts can access this data. This information is crucial for the proper functioning of the entire plugin, therefore, these definitions should also be provided in the project settings (under the LadyBug Tracker - Redmine section).

If you do not have admin rights, you must fill in this data manually. However, if you have an admin account, this data is automatically fetched from the server and saved in the project settings. These data are stored in project settings (Config/DefaultBugTracker.ini), allowing you to share them with the entire team.

Custom Fields		17 Array elements	+ -
▼ Index [0]		9 members	▼
	Format	Text	▼
	Name	Level	
	Description		
	Required	☐	
	Multiple values	☐	
	Default value		
	Possible values	0 Array elements	+ -
	User Role	Manager,Developer,Reporter,Viewer,Test	
	Version Status		

Unfortunately, not all data can be fetched even with an admin account.

The User Role field (only for fields of type user) must always be filled in manually.

The same goes for the Version Status field for fields of type Version.
